Abstract

In the age of pervasive computing, ubiquitous collaboration has become an every-day life paradigm. Without an ide computing infrastructure, issues with ubiquitous collaboration, such as network unreliability, platform heterogeneit client's resource constraints, are inevitable. The traditional replication scheme copes with network unreliability by replicating all the objects of a shared application together at once. This is, however, suitable for neither…

One of the authors, **Hironori Washizaki**, is working on a project right now.
